Question No 3:-

```
Function ~~input Read~~ InputReadings (t, sensors, hours)
    declare i,j
    for i=0 to sensors-1
        print "sensor i+1 (enter hours readings):"
        for j=0 to hours-1
            Input t[i][j]
End Function

Function analyzeSensor(r, hours) returns total, avg, max, min
                                  , critical, warning, streak
    Declare j, cur
    total =0
    critical=0
    warning=0
    streak=0
    cur=0
    max = r[0]
    min = r[0]
    for j=0 to hours -1
        total= total +r[j]
        if r[j] >max
            max=r[j]
        if r[j] <min
            min =r[j]
        if r[j]>=40
            critical = critical +1
        else if r[j] >=35
            warning=warning+1
        if r[j] >=35
            cur = cur +1
```

Scanned with CamScanner

Page2:-

```
        if cur > streak
            streak = cur

    else
            cur = 0
    avg = total / hours
EndFunction
Function highestAverage(t, sensors, hours) returns best sensor, Best Avg
    Declare i, j, sum, best, avg
    best = 0
    bestAvg = -1000
    for i = 0 to sensors - 1
        sum = 0
        for j = 0 to hours - 1
            sum = sum + t[i][j]
        avg = sum / hours
        if avg > BestAvg
            Bestavg = avg
            best = i
    return best +1
EndFunction
Begin
    Declare t[20][50], ~~senso~~ sensors, hours, i, ok, best, bestAvg
    ok = 0
    While ok == 0
        Print "Enter number of sensors (1-20): "
        Input sensors
```
